

TRAINING PROGRAMME

Cybersecurity for IT Teams

Understand the threats and put the essential defences in place

27 HOURS

FOR System and network administrators, support staff and IT managers

Mohamed Aziz BEN HAHHA

mohamedazizbenhaha.netlify.app

Overview

This programme gives IT teams the security knowledge they need in their daily work. Participants learn how attackers operate, then secure networks, Windows and Linux endpoints, access and data, run the basic security operations that make recovery from ransomware possible, and respond to an incident following NIST SP 800-61 Rev. 3. They finish with governance: policies, ISO/IEC 27001:2022, NIST CSF 2.0, GDPR and Tunisian Organic Law 2004-63 on personal data protection. Every chapter ends with a lab or exercise, and the programme closes with a final project in which teams assess a small company and present a hardening plan.

At a glance

#	PHASE	FOCUS	HOURS
01	Threats & Network Security	Threat actors, kill chain, common attacks, segmentation, firewalls, wireless	6 h
02	Endpoints & Access	Windows and Linux hardening, patching, EDR, MFA, least privilege, encryption, PKI	6 h
03	Operations, Response & Governance	Logs and alerts, backups and ransomware, incident response, policies and standards	6 h
04	Final Project	A security assessment and hardening plan for a small company	6 h
	Buffer	Catch-up, revision, extra lab time	3 h
	Total		27 h

Key facts

AUDIENCE	System and network administrators, support staff and IT managers
PREREQUISITES	None in security. Day-to-day IT administration experience (users, networks, Windows or Linux) is expected
DURATION	27 h: 24 h of chapters + 3 h buffer
FORMAT	Short lectures followed by labs and exercises on realistic company scenarios
LAB ENVIRONMENT	Runs locally: one laptop per participant (16 GB RAM) with Windows Server evaluation and Linux virtual machines and a pfSense firewall, prepared by the trainer; no cloud account or cost
ASSESSMENT	A lab or exercise validated at the end of each phase and a final project presented to the group; certificate of completion for participants who complete both
OUTCOME	Participants can recognise common attacks, harden networks, endpoints and access, prepare backups and a first incident response, and map controls to ISO/IEC 27001 and NIST CSF

PHASE 01

6 H

Threats & Network Security

Participants learn who attacks, how an attack unfolds and which techniques are most common, from phishing to network and application attacks, then reduce the network attack surface with segmentation, firewall rules and secure wireless. Validated lab: a segmented network on pfSense where only the allowed flows pass between users, servers and guests.

#	CHAPTER	CONTENT	FORMAT	HOURS
1.1	Threat Landscape & Attacks	Threat actors, kill chain, malware, phishing and social engineering, network and application attacks	Lecture + Workshop	3 h
1.2	Securing Networks	Segmentation, firewalls, wireless security	Lecture + Lab	3 h

PHASE 02

6 H

Endpoints & Access

Participants harden Windows and Linux machines and keep them patched, see what endpoint detection and response adds, then control access with MFA and least privilege and protect data with encryption and certificates. Validated lab: a Windows and a Linux server hardened against a checklist, with administrative access limited and logged.

#	CHAPTER	CONTENT	FORMAT	HOURS
2.1	Securing Endpoints	Windows and Linux hardening, patching, EDR	Lecture + Lab	3 h
2.2	Access & Cryptography	MFA, least privilege, encryption, PKI basics	Lecture + Lab	3 h

PHASE 03

6 H

Operations, Response & Governance

Participants collect the logs and alerts that matter and build backups that survive ransomware, respond to an incident with the NIST SP 800-61 Rev. 3 approach, then frame security as governance: policies, ISO/IEC 27001:2022, NIST CSF 2.0, GDPR, Tunisian Organic Law 2004-63 and security culture. Validated exercise: a ransomware tabletop exercise worked through by each team, with the restore tested.

#	CHAPTER	CONTENT	FORMAT	HOURS
3.1	Security Operations	Logs, alerts, backups and ransomware resilience	Lecture + Lab	1.5 h
3.2	Incident Response	NIST SP 800-61 Rev. 3, first response, communication	Lecture + Workshop	1.5 h
3.3	Governance & Risk	Policies, ISO/IEC 27001:2022, NIST CSF 2.0, GDPR and Tunisian Organic Law 2004-63, security culture	Lecture + Workshop	3 h

PHASE 04

6 H

Final Project

Teams of two or three assess the security of a small company described in a written brief and its lab network, reusing the phase labs, then present a hardening plan as they would to its management.

#	CHAPTER	CONTENT	FORMAT	HOURS
4.1	Brief & Assessment	Read the brief, inventory assets, identify risks, check the lab network against the controls of the course	Project	3 h
4.2	Plan & Policies	Prioritised controls, key policies, incident response checklist	Project	1.5 h
4.3	Presentation & Review	Present the plan to the group as to management; questions and feedback	Project	1.5 h

FINAL PROJECT

Security Assessment of a Small Company

A small company assessed from its brief and lab network: risks, prioritised controls mapped to ISO/IEC 27001 and NIST CSF, key policies and an incident response checklist, presented as a hardening plan.

STACK pfSense, Windows Server, Linux, risk register, ISO/IEC 27001:2022 and NIST CSF 2.0 references

DELIVERABLE Risk register, hardening plan, policies, incident response checklist, presentation
